Unleash investment avalanche - trigger economic boom

The concept is simple:

- * Reduce labor costs
- * More net,
more purchasing power
- * Motivation for
future investments

The profitability calculation

Central to every economic decision is the profitability calculation. This is determined by the laws of nature, the art, the loan terms and what is often overlooked, the tax system.

As with any equation, parameters can be exchanged between input and results. On the input side, unnoticed but determining: the tax system. On the result side "after how many years, the investment will pay".

The profitability calculation differently, "After how many years the investment pays" as an input parameter, the tax system on the results side.

Let's look on many future investments beyond 15 years of profitability. What would be the tax system to reduce this down to typi-

cally 5 to 10 years to profitability?

Tax reform: example Germany

- * 180 EURO per month less
employer part social insurance
- * 180 EURO per month less
employee part social insurance
- * EUR 200 per ton of CO2 tax

Tesla is building a 50 GWh annual production battery factory. Worldwide 200 factories of this size are needed plus the photovoltaic factories plus the production of raw materials for the new industry.

Professional investors see no opportunity to invest over US\$ 1,000 billions. They would invest all this money into the real economy, if this tax reform would hit at last all Europe. Into all the future technology that is suddenly highly profitable by the tax reform.

CO2 tax

~~Instead of 300 t
oil gas coal
throwaway energy~~

Energy technology forever

The per capita lifetime energy consumption in Germany is 300 t of oil, gas and coal, which are burnt with 500 t oxygen to 800 t CO₂.

The solution to this problem can not be save, restrict and refrain, but about 3 t energy technology, that is recycled every few decades.

The possibilities of solar power were belittled for decades, especially by those who are supposed to promote it.

Global wealth is not only possible, but a necessity to bring civilization to a new stable level.

Impoverishment of the poor

In the last 5 years the poorer half of mankind, has lost considerable assets. This trend has to be reversed.

Asset building for the poor

Target 10 * more assets for the poorer half of mankind in the next 25 years.

Thus, the level of today of the poorer half of Germans would be reached.

An important component here is the own energy production. 500 Watt photovoltaic is now the statistical average in Germany. Then this should be the average of the poorer half of humanity. Additional 2 kWh battery.

The rich half of course would have many times more. Vast production capacity has to be built.

We need not only to replace the fossil energy industry in the coming decades, but have to far exceed: The poor people, the population growth and the need for an ever more perfect recycling.
